

Proof that not everything in water gets left behind after evaporation including the chemicals ai uses which makes it toxic to drink

Posted by u/Experamenta1 • 0 points • 3 comments

This is for the little kid who is spreading mis information

Pedantically speaking this can be true in some cases, like steam distillation for instance, as well as azeotrope formation or partial pressures of volatile compounds in solution.

This isn't a concern for the water used in evaporative cooling systems for data centers. None of the additives that might be used for various reasons are carried along with the vapor in any amount worth considering.

Lmao. No.

1. Water is not used as fuel for the AI. It's there to transfer heat from the computer parts, away from the computer parts. They sometimes add small amounts of anti-corrosive agents, antifreeze, or algae killers into the water to ensure it doesn't break the pipes - but they're not adding some 'horribly toxic death acids' into it to fuel the AI.
2. Minerals and material get left behind when water evaporates. Evaporation does not carry other materials with it. Evaporation purifies it. This is basic science.
3. Remaining, non-evaporated waste water is treated before going anywhere else.
4. Stop being a little kid spreading misinformation. Pay attention in your science lessons.
