

Does new water-positive data centers, and switch of companies to be fully water-positive in 4 years, change your opinion on AI usage?

Posted by u/LerytGames • 0 points • 11 comments

Extensive water usage for cooling is primarily problem of old data centers. Which companies like Google has a lot. New data centers are using effective closed loop cooling technologies and there is big pressure on lowering water consumption even more.

Companies like Google, Microsoft, AWS and Meta has goal to upgrade their data centers to became fully water-positive in 4 years (by 2030). That means that data centers will replenish or conserve more water than they consume.

Does this technology upgrade change you opinion on AI usage?

No, they should still all be dismantled

Nope. The water issue is one among many, and outside of areas where the water supply is already stressed to the breaking point is a minor issue. Power demands which we end up paying for, resource usage, a wave of endless slop and a very harmful bubble, all for a technology that's not very useful, are all greater issues all around.

u/Fair_Blood3176 • 1 points • 2026-02-07 22:14 UTC

I don't see how anyone can justify the US of AI when all you have to do is take a look at what kind of people are running these companies. Evil begats evil.

u/Vanhelgd • 1 points • 2026-02-07 22:10 UTC

The promises of these companies may as well be scrawled on used toilet paper. That's how valuable they are.

u/Mackyishere • 0 points • 2026-02-07 21:34 UTC

Nope. It's not an ai or technology problem, but rather it's a human over population problem

u/NotAFloorTank • 1 points • 2026-02-07 21:29 UTC

Nope. It's not addressing the fact they still use a fuckton of power, nor the emerging concerns about it impacting users' brain function. Or its spreading of misinformation, or the fact that the models were mostly trained on stolen data. Or how it is being used to try to circumvent paying people properly, especially creatives. Or any of the other concerns.

u/Trobilus • 1 points • 2026-02-07 21:29 UTC

Slightly. Very slightly.

u/skaichai • 3 points • 2026-02-07 21:12 UTC

will gen-AI ever generate enough revenue to actually produce the electricity to run itself without tax exemptions, rate hikes, and loans? will its brain damaging slop make up for the extensive ecological impact on the communities where data centers are built? the severe psychological impact imposed upon younger generations who do not have a say? the severe ethical concerns that no one seems to want to talk about? all while regulatory institutions remain complacent?

water-positive data centers won't solve any of these issues. the techno-fascists in charge of these companies can take their "intelligence" and shove it up their ass.

u/jewishSpaceMedbeds • 1 points • 2026-02-07 21:05 UTC

No.

It's still using power we can't spare, training on stolen data and turning the internet into a useless, soulless garbage dump.

u/Mad_Jackalope • 3 points • 2026-02-07 21:01 UTC

How would that be positive? Do they clean water and return it to the water cycle? Even more water than is used to create the hardware they use?

Google and others said that their server farms would go more towards renewable power sources, and now they use gas generators to power them.

u/densitycreep • 3 points • 2026-02-07 20:56 UTC

no it still sucks
