

How DOES AI use water?

Posted by u/SimpleyIdiot • 0 points • 1 comments

I just do not understand at all. Do AI datacenters not use a closed loop system? When I think of water cooled computers, I usually think of radiators and loops you find in enthusiast made gaming or professional PCs. Do larger servers not use this same system but scaled larger? Is AI really using as much water as news says? And why does every source I find seem to have a different answer?

Thanks for your submission /u/SimpleyIdiot, but it has been removed for the following reason:

****Rule 2: Please try to use the search function before posting anything.****

Thanks for posting, but this question happens to be one that has been asked and answered here often before - sometimes in the same day! That can get frustrating for our dedicated users who like to answer questions. Or maybe you're just asking the same question too often - why not take a break for a while?

Sometimes questions that come up too often get put in our [Most Frequently Asked Questions list] (<https://www.reddit.com/r/NoStupidQuestions/wiki/index/faq/>). Other times, it may just be that we're getting a flood of questions about a topic (especially when something is in the news). Or maybe you keep asking the same question again and again - something that annoys our users here. Please don't do that! Next time, please try searching for your question first before asking. Thanks!
