

Im curious about how energy demand varies in AI requests

Posted by u/Happerflu • • 0 points • 5 comments

I'm doing a school research on AI, and I want to investigate the environmental impact different people have based on their AI use.

Anyone well-researched on AI? (The different calculations it undergoes to do its job, etc.) or know good resources I can start digging through so I can get a good estimate of how people's ai use affects energy outcome? It would be very appreciated

Juts make sure you are using current data. If it is ovr a year old, it most likely is not up to date on D2C or PUE information
