

Reminder that data center don't consume a vast amount of water.

Posted by u/barryhalsacs • 0 points • 2 comments

Let's talk about water. So right off the bat it seems like "oh this is pro LLM". No. There's 3 types of water that we gonna talk about. Municipal, industrial, and ultra purified. The manufacturing of all computer chips uses a very small amount of ultra pure water. Not much water but this water is way more valuable because it takes a lot of work to purify. The data centers also use water for cooling but it's actually tiny. The corn industry uses 80 times more water. Lawns use more and they are just cosmetic. Golf courses. Clothing industry. Pair of jeans uses 2600 gallons of water according to to department of the environment. Also using ai is not the right term. LLM or diffusion model for images is far superior

So my water bill doubled and RAM prices quadrupled for no reason?

Ok nasty sloppy bro.

Make the whole workd bow to your embarrassing addiction, lol pathetic

u/user_857732 • 1 points • 2026-02-28 06:19 UTC

edit: oh i got bottled maybe

u/minoe23 • 6 points • 2026-02-28 05:25 UTC

Pretty sure almost everyone here also agrees that lawns with just grass and golf courses with turf are also a waste. And yeah, corn uses a lot of water and we should transition to less thirsty crops and other, more sustainable farming practices. None of us are denying that. But guess what corn does that AI datacenters don't? Feed us and our animals! Textiles? Yeah, we wear those or carry things in those bags or whatever other real, practical purposes textiles get used for. We generally need clothes for various reasons depending on where you are and what time of year it is (i.e. the sun and the cold where I am currently).
