

Fossil generation could rise with faster-than-expected growth in data center power demand

Posted by u/dumnezero • • 0 points • 4 comments

>Electricity use by data centers is driving the electricity demand growth. Continued development of these large computing facilities and growth from expanded industrial use of electricity are likely to continue driving growth in U.S. electricity demand in the near term.

Maybe briefly, but AI is more likely to accelerate better energy systems.

Big jumps in electricity demand usually push investment in new infrastructure. Tech companies running AI data centers are already funding huge amounts of renewables, nuclear, and grid upgrades because they need reliable long term power.

So even if fossil use bumps up for a bit while grids catch up, AI demand will likely speed up the transition to larger and cleaner energy capacity.

Bruh, read the articles. They turning on old coal plants and using jet engines to get more juice.
