How do we know how much water each AI prompt uses.

Posted by u/Holiday_Guidance_414 • 0 points • 2 comments

I wasn't exactly use where to put this question so here!

Honestly, the only way I can imagine it is the water pouring into a tank with every message. I know that isn't likely what's happening, but I'm so confused on how we can measure that a viewing a Tiktok uses ≈ 0.09 ounces, or a ChatGPT prompt uses ≈ 16.9 .

Well out of all the things Gen AI does text generation is probably the least offender, as my desktop computer can generate text without much issue. (tried mistral once on my main machine as its one of the few open source LLM's you can run locally)

But image and video genratrion is another can of worms

It takes a lot of data and averages. <https://www.eesi.org/articles/view/data-centers-and-water-consumption>
