AI Hype over and now it comes to chips, data centers and energy generation and consumption ?

Now race is among who owns data centers ? How they will run (energy) ? Solar operated ? In Space ?

What are your thoughts on this ?

The profits of the firms may be hype, but that actually implies the technology is more powerful since it will be easy to access and thus open source, free/cheap to use. I don't understand how "hype" can be over when we're still seeing progress in A.I and robots, or do you dispute that? Data-centers will continue to grow for a while, while the models become more efficient, eventually we'll reach carrying capacity for our purposes. The sun is a great constant source of energy, I eventually think some will be in space. Nuclear energy, or even geothermal is another option.

u/XIFAQ • -1 points • 2026-03-30 21:31 UTC

But there is no profit yet or in near future. And Sun is not always there everywhere.

You could have made that same claim about PCs in 1985. They weren't profitable, companies were wasting time and resources on novel concepts, they were difficult for the average person to operate, despite promises that they'd streamline office work - they actually made things worse...

u/XIFAQ • 1 points • 2026-03-31 13:44 UTC

But here it is AI which need more and more energy and money too.

u/QuietBudgetWins • 3 points • 2026-03-30 21:13 UTC

honestly the ai hype movin to chips and data centers makes sense but the energy side is where it gets tricky runnin these at scale without insane costs or emissions is not simple solar helps a bit but there are limits feels like we are just startin to figure out what efficiency really means at this level

Bubble is going to burst this year itself it seems.

u/Treehugger670 • 1 points • 2026-03-30 21:37 UTC

Oh yeah, I don't mean to force the war into this convo but without the Golf States (GCC) investments into data centers and infrastructure buildouts, the bubble is set to burst pretty quick.

u/XIFAQ • 1 points • 2026-03-30 21:46 UTC

True.

I hope my state will figure out how to embrace data centers and do it quickly. I think the longer it takes to welcome technology the more we have to lose.

u/XIFAQ • 1 points • 2026-03-30 20:22 UTC

But chips, power is the issue and arriving very soon.

u/Sufficient_Wheel9321 • 2 points • 2026-03-30 20:08 UTC

Why would you assume the hype is over? AI companies are still operating unsustainably and loosing money at a rate that makes it questionable if they will EVER make it back. When the companies become financially sustainable, then I would say the hype is over.

u/Head-Common-324 • 0 points • 2026-03-30 20:16 UTC

why would that make the hype over?

u/Sufficient_Wheel9321 • 2 points • 2026-03-30 21:39 UTC

Usually when people refer to hype in businesses is because the business value is consider less than what plays out in the market. When you truly see businesses that are operated by 5 people that's making 10 millions in annual revenue because they are operating like a business that has 100s of employees because of AI agents (this is an example, don't take this literally), then it's not longer hype. But, in order for that happen the AI company has to be sustainable because if they go under, then the businesses that depend on them go under hence the AI company doesn't live up to the hype.

Hype is not measurable, it's subjective so you can take that with a grain of salt.

u/XIFAQ • 1 points • 2026-03-30 20:12 UTC

And will they ? I don't think so. Not in a decade.
