Google says it "dropped the energy cost of AI queries by 33x in one year"

Posted by u/Moth_LovesLamp • 0 points • 2 comments

[Google says they decreased AI energy costs but even people in the comments are pointing out it's likely bullshit](<https://arstechnica.com/ai/2025/08/google-says-it-dropped-the-energy-cost-of-ai-queries-by-33x-in-one-year/?comments-page=1#comments>) lol

So one "AI" query uses as much energy as nine seconds of TV

>A 5000 mAh smartphone battery is equivalent to about 18.5 Wh, which means 74 text prompts will drain it to zero.

Another comparison

>A tesla cybertruck has a 123kWh battery bank \[...\] it'll get about 0.45m/18 inches per Wh, or about 11cm/4,3 inches on the power needed for one of the example LLM prompts

But like people pointed out, even it's real it probably doesn't even matter considering demand for Gemini increased.

"The one thing that Google could have made a reasonable estimate of, but didn't, is the impact of training its models. At this point, it will clearly know the energy costs there and can probably make reasonable estimates of a trained model's useful lifetime and number of requests handled during that period. But it didn't include that in the current estimates."

So Google didn't include the most energy intensive part of the process when producing their energy report.

AI companies are desperate to shrug off the discussion on their environmental impact.

If Google did lower power usage than yeah that's better than nothing, but I honestly doubt they actually

did lower power utilisation by that much, especially because they are still expanding their AI infrastructure massively.
