My big collection of counter-arguments to common concerns about AI and the environment

Posted by u/MrMasley • 0 points • 2 comments

I've tried to write about basically every major issue with data centers and individual AI use people are concerned about, and consistently come away thinking:

1. AI is not a serious environmental problem, at least right now.
2. Many people are confused by data centers' ability to concentrate huge aggregates of individually tiny computer tasks into one building. If the tasks were dispersed among regular computers, no one would have an issue with them.

>Data centers in America had a consumptive water use of 200-250 million gallons of water per day in 2023 (including offsite water used in normal power plants generate the electricity). If we just look at the consumptive water use in the data centers themselves, it was more like **48** million gallons of water per year. Shouldn't it be per day?
