

# This is the environmental disaster behind AI

Posted by u/EchoOfOppenheimer • 0 points • 6 comments

In this clip from **\*\*AsapSCIENCE\*\***, we learn the shocking truth: massive AI data centers from Microsoft, Meta, Tesla, Google, and Amazon consume enormous amounts of electricity *\*and\** millions of gallons of fresh water just to stay cool.

Datacenters don't typically use drinking quality water, it's not necessary and more expensive. Primary datacenter cooling is adiabatic which does not require the water to be free of impurities.

This guy is manipulating his words to be alarmist. He presents Fresh water reporting to be equivalent with drinking water when it is not.

u/IsThereAnythingLeft- • 1 points • 2025-12-05 12:30 UTC

That's only in the US. On Europe the cooling systems are mostly closed loop so use very little water. Another reason people should be trying to build more DCs there

u/goose1441 • 4 points • 2025-12-05 12:47 UTC

From what I've seen in design, almost everyone has moved to closed loop these days.

u/SuperMundaneHero • 1 points • 2025-12-05 12:42 UTC

Easier to just adopt closed loop.

u/IsThereAnythingLeft- • 1 points • 2025-12-05 14:32 UTC

Got to be well out of power in the US too with all that planned

u/SlideFire • 8 points • 2025-12-05 12:21 UTC

This guy is extremely ignorant
