

The global south will be the hardest hit areas by the environmental impact of generative AI data centres.

So besides the “lol omg pro-ai bros are so sensitive”, the genuine “head in the sand” that ai proponents do is, at best, grifter cockiness, and at worst, xenophobia.

For YEARS there’s been a huge crowd of dissenters trying to tell people that AI data centres will disproportionately affect poor and minority communities harder than affluent communities, particularly in the global south.

The actress Ayo Edebiri was harassed by AI bros last year because she posted a series of infographics on YouTube that forecasted that openAI data centres would, by 2028, use the ****same amount of water to cool their server centres as the entire nation of New Zealand uses for personal, business, and agricultural usage.**** At the time it was shocking that one company would place that much stress on a countries infrastructure. Now, we have Meta, Google, Microsoft, Samsung, Apple, and others, all vying to dry out the planet first.

It’s kind of a weird silent confession going on with AI bros. They usually want to either avoid or mock this topic. But these same people who think AI is some digital messiah that will solve all the problems, cure all the diseases, and make up leap forward like never before.... doesn’t suggest that AI will fix this issue.

Maybe they cannot bring themselves to admit AI causes and issue to begin with, or maybe deep down they know it can’t as you can’t run these data centers from nothing. But the fact that they never suggest their glorified chat bot isn’t solving this issue is a huge tell.
