

AI Power Use Set to Outpace Bitcoin Mining Soon

Posted by u/CyrusIAm • 0 points • 33 comments

- * AI models may soon use nearly half of data center electricity, rivaling national energy consumption.
- * Growing demand for AI chips strains US power grids, spurring new fossil fuel and nuclear projects.
- * Lack of transparency and regional power sources complicate accurate tracking of AI's emissions impact.

I'm surprised this hasn't happened yet

The problem I have with almost every energy-related argument against AI is that nobody breaks these things down on a **per user** basis.

I remember seeing one article that pointed out how training GPT-3 used as much power as the annual consumption of ~150 US households. It was meant to convey that AI uses an ungodly amount of electricity, but in my opinion it did the exact opposite. Yeah, the equivalent of 150 households is a lot of electricity in absolute terms, but to create a large language model that was used by **billions** of people and contains a considerable portion of the sum of all human knowledge? That amount of electricity is so small it shouldn't even be talked about.

The electricity cost of me running gemma:27B on my RTX 5090 is 0.027 cents for a prompt that takes 20 seconds to answer. That's the same amount of electricity it takes for me to drive my Tesla 36 feet.

And this is why I'm bearish on crypto.

We're gonna run out of power soon and AI is generating much more value than BTC, only a matter of time before all data centers are AI data centers

Only Retards believe Bitcoin energy is as high. Humanity has lost its basic instinct for simple deduction. Let me break it down for you.

The entire world runs on data centers. Google, Amazon, all the companies in Europe and China. Energy runs the world. AI will make it larger.

We are told BTC is a threat due to high energy use, and it's departing the world. Bullshit. A single asset class BTC, worth less than Apple at market cap and uses energy to mine 15 Billion of value globally/year. Compare that to the 2 Trillion in GDP injected by the Tech industry as a whole, which also is based on energy. It's like .01%.

The world is not directing all its energy into making a single product such a miniscule amount of asset value. It's insanity to even think that. It's using energy for the tech industry, to power your homes, cars, industries ect.
